Sinag Catering Web App – System Revisions Checklist 2

1. *Landing Page Hero Section – Dynamic Event Showcase Background*

- **Feature:** Dynamic Event Background Slideshow / Carousel
- **Area:** The main red highlighted section container (as shown in 1 PHOTO).
- **Action:**
    - Implement a dynamic background image loader (slideshow, carousel, or smooth cross-fade effect) inside the hero container.
    - Fetch the display images dynamically from our stored event gallery / database asset folder containing past Sinag's Catering events (weddings, debuts, kids' parties).
    - Apply a subtle dark or light gradient overlay (opacity mask) over the background images to ensure the text, logo, and buttons remain sharp, legible, and high-contrast

2. *Client Portal Login – Remove Admin Toggle Tab*

- **Feature:** Public Login Screen UI Refinement
- **Area:** The "Sinag Portal Access" login card (2 PHOTO).
- **Action:**
    - Remove the "Client Sign In" vs. "Admin Console" toggle pill selector from the top of the login box entirely.
    - Keep only the standard client login interface.
- **Rationale / Behavior:** Regular users and defense panelists should only see the client-facing login/registration portal. The admin login path should be completely hidden or routed separately (e.g., via a secure backend URL) to prevent unauthorized guessing or cluttering the public UI.

3. *AI Package Finder – Budget Constraint & Price Matching Logic*

- **Issue:** In the "AI-Guided Package Finder" screen (3 PHOTO), the AI recommendation matching logic does not properly align the user's input budget (**Red Box**) with the output estimated total (**Blue Box**).
- **Action & Logic Fix:**
    - **Strict Maximum Constraint:** The AI-generated package price (**Blue Box**) must **never exceed** the user-entered budget limit (**Red Box**).
    - **Optimal Matching:** The recommendation algorithm should evaluate available packages, pax add-ons, and entertainment options to recommend the highest-value package configuration that fits **under or equal to** the entered budget (e.g., if the user inputs PHP `150,000` for 100 pax, it shouldn't just stop at a lower PHP `63,000` base tier if a richer tier/customization exists within the PHP `150,000` ceiling).
    - **Reactive Updating:** Ensure that whenever the user changes the budget input or toggles the entertainment options, the recommended package name and estimated total update dynamically in real time.

4. *Customize Event Tab – Menu Selection (Main Dishes & Pasta)*

- **Feature:** Interactive Menu Selection Grid
- **Area:** Package Inclusions / Customization Section (4 PHOTO).
- **Action:**
    - Add a selectable checkbox/card grid section for the client to choose their specific menu options.
    - **Options to Display:**
        - **Main Dishes:** Beef Broccoli, Cordon Bleu, Menudo, Caldereta, Mixed Veggies, Chicken Curry, Fish Fillet
        - **Pasta Dishes:** Pancit, Spaghetti, Carbonara
    - **Validation Constraint:** Enforce a strict **maximum selection limit of 4 items total** across the food options. Once 4 checkboxes are selected, disable the remaining checkboxes (or show a validation message: *"Maximum of 4 dishes selected"*).
    - **Data Saving:** Include the selected 4 dish choices in the final booking summary payload saved to the database and sent to the admin inspection modal

5. *Optional Extra Food Add-ons – Dynamic Dish Selector Dropdowns*

- **Feature:** Conditional Dropdown Spawning for Extra Dishes
- **Area:** "Optional Extra Food Add-Ons" Section (5 PHOTO).
- **Action & UI Logic:**
    - **Dynamic Triggering:** When a user increments the counter (+1 or more) on **Extra Main Dish** (+PHP 100/pax) or **Extra Pasta Dish** (+PHP 80/pax), dynamically spawn a corresponding dropdown selection box directly beneath or within that add-on card.
    - **Dropdown Contents:**
        - **Extra Main Dish Selector:** Spawns a dropdown populated with the Main Dishes menu (*Beef Broccoli, Cordon Bleu, Menudo, Caldereta, Mixed Veggies, Chicken Curry, Fish Fillet*).
        - **Extra Pasta Dish Selector:** Spawns a dropdown populated with the Pasta Dishes menu (*Pancit, Spaghetti, Carbonara*).
    - **Multiple Add-ons Handling:** If the user increments the count higher than 1 (e.g., `+2 Extra Main Dishes`), spawn an additional dropdown field for each added dish so the user can select specific distinct choices.
    - **Data Sync:**
        - Recalculate the overall per-pax estimate dynamically in real-time.
        - Append the specific dish names chosen from these add-on dropdowns into the final booking summary payload for the admin inspection modal.

6. *Booking Calendar – Date Picker Constraints (14-Day Advance Booking Rule)*

- **Issue:** The calendar picker allows users to select past dates or immediate upcoming dates (e.g., selecting October 4 when the current date is October 10, ON 6 PHOTO).
- **Action & Logic Fix:**
    - **Enforce 14-Day Lead Time:** Configure the calendar component's `min-date` validation logic so that selectable dates start strictly **at least 14 days (2 weeks) from the current date (`today + 14 days`)**.
    - **Disable & Dim Invalid Dates:**
        - Automatically disable, gray out/dim, and render non-clickable all past dates and any dates falling within the 14-day advance notice buffer.
        - Keep existing blocked/reserved date logic active for fully booked dates.

- **Default Date Focus:** Set the calendar's initial default focused view or default date auto-selection to the **first available valid date** (i.e., exactly 14 days ahead of today) rather than allowing the cursor to land on disabled dates.
- **Form Validation Guardrail:** Ensure backend validation rejects any submitted booking payload where `booking_date < current_date + 14 days` to prevent bypass

7. *Booking Form UI – Real Asset Integration (Event Showcase & Owner QR Code)*

- **Feature:** Production Asset Replacement (7 PHOTO)
- **Area 1: Red Box (Event Showcase Photos / Kids Birthday Showcase Photos):**
  - **Action:** Replace the current placeholder/stock images in the showcase carousel with actual event photography from Sinag's Catering past events (e.g., real kids' party setups, balloon garlands, stage backdrops, and table styling). Ensure the images match the selected event category dynamically.
- **Area 2: Blue Box (QR Ph / GCash QR Code):**
  - **Action:** Replace the default placeholder QR code image with the official owner's QR code asset uploaded to the shared Google Drive folder (`Sinag's Catering Services - Sunshine C.`, mobile number `0928 714 4597`). Ensure it scans and displays correctly under the QR Ph / GCash payment instructions

8. *Admin Dashboard – Booking Inspection & Staffing Modal Revisions*

- **Feature:** Extended Booking Details & Service Assignment Checklist
- **Area:** "Booking Inspection & Staffing" Admin Modal (7 PHOTO)
- **Action Item 1: Package Breakdown Details (Red Box)**
  - Expand the **PACKAGE & EVENT DETAILS** block to display the complete selected menu breakdown.
  - Explicitly render the specific food items chosen by the client during booking (e.g., *Selected Main Dishes*, *Selected Pasta Dish*, and any *Extra Food Add-ons* requested).
- **Action Item 2: Subcontracted Services Checklist (Blue Box)**
  - Alongside the staff assignment list, add a dedicated **Assign / Track Event Services** checklist block.
  - **Service Checkboxes to Include:**
    - $\square$ Event Host
    - $\square$ Clown / Entertainer
    - $\square$ Photo Booth
    - $\square$ Photographer
    - $\square$ Lights and Sounds
  - Ensure the selection state of these assigned external services saves cleanly alongside the roster data when clicking **"Save Staff Roster"** (or rename to *"Save Roster & Service Assignments"*)

9. *Admin Action Buttons – Text Contrast & Contrast Ratio Fix*

- **Issue:** In the admin table/action panel (9 PHOTO), the highlighted/filled action button (**Red Box**) has a text color that matches or blends too closely with its background color, rendering the button label completely unreadable

10. *Admin Dashboard – Master Interactive Operations Calendar*

- **Feature:** Admin Visual Calendar Sync
- **Area:** "Date Availability" / "Calendar Date Blocking Coordinator" Section (10 PHOTO)
- **Action & Component Integration:**
    - **Embed Master Calendar Component:** In the empty section directly beneath the date picker and blocking badges (**Blue Box**), integrate an interactive monthly grid calendar component matching the client-facing calendar design.
    - **Real-Time Data Sync:** Bind this admin calendar directly to the database schedule state (Supabase `bookings` & `blocked_dates` tables) so it dynamically reflects all system activity in real-time:
        - **Green / Confirmed Badges:** Display confirmed bookings and their count (e.g., *2 bookings*).
        - **Orange / Pending Badges:** Highlight dates with active pending reservation requests awaiting review.
        - **Red / Blocked Badges:** Render administrator-blocked maintenance/holiday dates.
    - **Interactive Actions:**
        - Clicking any date cell on this calendar should open the corresponding **Booking Inspection Modal** or automatically populate the "Block Date" input field for quick manual date locks.
        - Toggling/blocking a date directly on this calendar must instantly reflect on the public-facing client booking calendar.

11. *SMS Integration – Pipeline Audit & Payload Verification*

- **Issue:** The "Send Test SMS" panel shows a success message [11 PHOTO], but texts are not delivering to target handsets

12. *Admin Dashboard – Master Reservations Register (Completed Tab & Full Cash Settlement)*

- **Feature:** Final Cash Settlement & Completed Events Tab
- **Area:** "Master Reservations Register" Panel (12 PHOTO)
- **Action Item 1: Add "COMPLETED" Filter Tab (Red Box)**
    - Add a **COMPLETED** filter tab alongside `ALL`, `PENDING`, `CONFIRMED`, `CANCELLED`, and `FORFEIT`.
    - This tab will store all archived, fully settled, and finished events.
- **Action Item 2: Add "Full Payment" / "Mark as Fully Paid" Button (Blue Box)**
    - On rows with a **CONFIRMED** status and an active **DOWNPAYMENT** status, display a green **"Full Payment"** (or *"Mark Fully Paid"*) action button in the actions column.
- **Action Item 3: Backend Logic & Analytics Sync**
    - **Accounting Trigger:** When the admin clicks **"Full Payment"**, prompt a brief confirmation dialog: *"Confirm receipt of remaining 50% cash balance?"*
    - **Revenue Calculation Update:** Automatically register the second 50% payment entry into the system's financial logs so that the total recognized revenue matches **100% of the booking's total amount** (e.g., matching the full PHP `52,000` or PHP `60,000` total value in system analytics).
    - **Status Transition:** Update the booking payment status to **FULLY PAID** and the booking status to **COMPLETED**.
    - **Archival:** Automatically move the booking record out of the active **CONFIRMED** list and into the **COMPLETED** tab

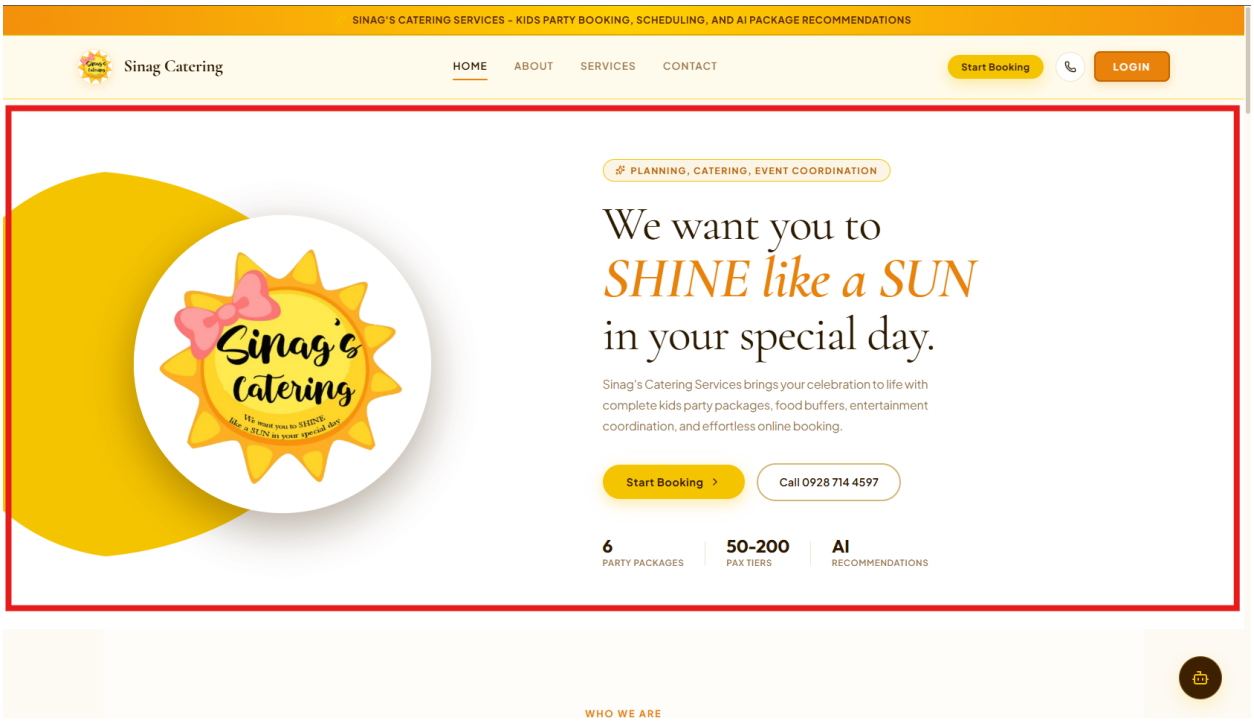

13. *Executive Dashboard Analytics – Live Sync for "Fully Paid" Status*

- **Feature:** Real-Time Financial Analytics & Revenue Breakdown Integration
- **Area:** "Executive Dashboard" (13 PHOTO)
- **Action & Logic Fix:**
    - **Revenue Breakdown Shift:** When a booking's payment status transitions from `DOWNPAYMENT` to `FULLY PAID` via the Master Reservations Register, the corresponding monetary value must dynamically move from the **Downpayment** progress bar/tier into the **Fully Paid** bar/tier on the dashboard's Revenue Breakdown chart.
    - **Gross PHP Revenue Metric:** Update the **Gross PHP Revenue** summary card so it accurately calculates and displays total collected revenue (accounting for both initial downpayments and fully settled cash balances).
    - **Reactive State Binding:** Ensure all dashboard metrics (Gross Revenue, Confirmed/Completed counts, and Revenue Breakdown bars) use reactive Supabase subscriptions or real-time state fetches so changes made in the reservations register reflect instantly on the analytics hub without requiring a manual browser refresh.

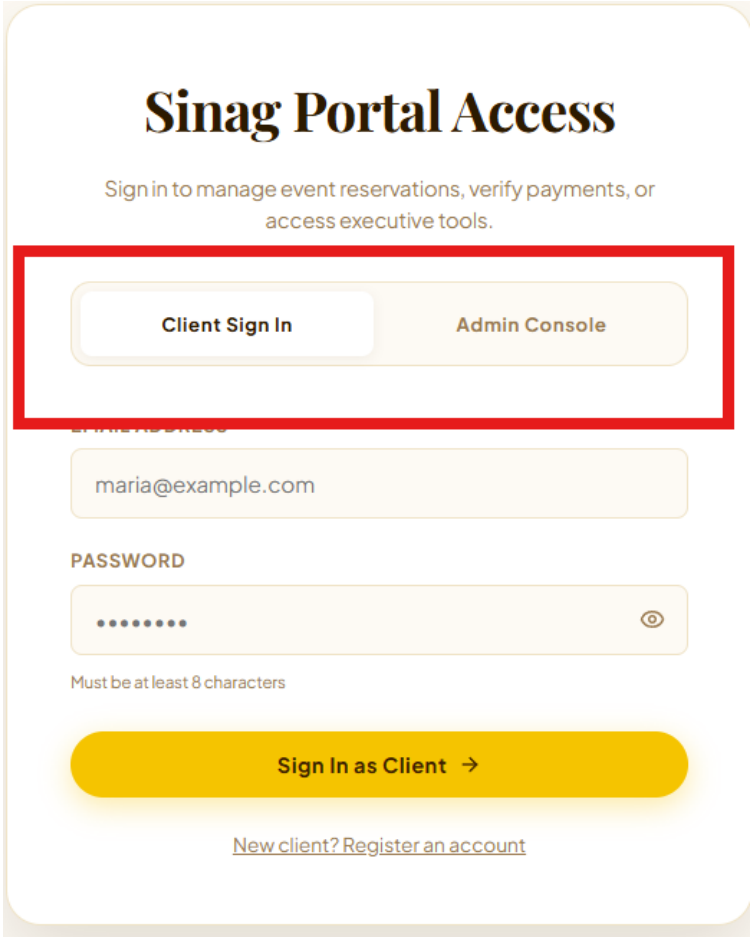

14. *Client Services Desk – Payment Proof Mandatory Validation & Button Contrast*

- **Feature:** Downpayment Verification Safeguard & Contrast Fix
- **Area:** Client Services Desk Reservation Panel (14 PHOTO)
- **Action Item 1: Mandatory Fields Validation (Red Box)**
    - **Strict Form Validation:** In the **"Submit GCash / Maya Reference & Screenshot"** block, set both the **Reference Number input field** and the **Proof of Payment File Upload (`Choose File`)** button as mandatory (`required`).
    - **Submit Button Blocking:** Disable the **"SUBMIT PAYMENT PROOF"** button by default. Only enable it once a valid reference number is entered *and* an image file is attached.
    - **Error Handling:** If the user attempts to submit without both fields completed, prevent form submission, highlight missing fields in red, and display an inline warning message: *"Please provide both the payment reference number and screenshot proof before submitting."*
- **Action Item 2: Button Text Contrast & Highlight Fix (Blue Box)**
    - **Contrast Adjustment:** Fix the contrast on the secondary action buttons (e.g., **"CANCEL RESERVATION"** and **"REBOOK DATE"**).
    - Ensure the text color uses high contrast against the background fill/border and does not blend or become unreadable when focused, hovered, or highlighted.
    - **Active / Hover State:** Use explicit, readable styles (such as dark orange text on standard state `#D97706` shifting to crisp white text on solid orange background `#D97706` during hover/highlight)
